                                                                                                                      The present sequence represents a human tropoelastin splice form. The present sequence represents a human tropoelastin splice form. The prepalsation describes, in which a subsequence concerning the properties of the susceptibility of the subsequence has been inserted so that susceptibility.

To proteelysis is increased. The derivatives have with reduced or consequence to proteelysis is increased. The derivatives have with reduced to easily, e.g. in complete the wild-type protein would be degraded too easily, e.g. in complet with sarum or wound exudate. The corpoelastin derivatives provide competitive inhibition of protease activity the tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivatives provide competitive inhibition of protein containing tropoelastin derivative derived protease-usceptibility in a national proteins are useful for referring agents and for inducing chemotrals. They are also contained to referring agents and for inducing chemotrals the protease of proteins propelastin derivatives are competitive inhibitors of cleavage site in tropoelastin derivatives are competitive inhibitors of cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for proteins against lung damage conset by clearating, for inhibiting or controlling localized growth of cancers or metastases, or to limit protease activity that causes blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PGVGYGGIPTYGYGAGGFPGFGYGYGGIPGYAGYPSYGGYPGYGGYPGYGGSPAQAAAA 420

ó
The invention relates to a derivative or variant of human tropoelastin (MTS) having elastin-like and/or macronolecule (specifical) by delivorsaminolytom (eds)) binding properties. Cells containing vectors comprising the nucleic coids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hypicid proteins containing the derivatives are useful in medical, whithis or hand lottins, also as surgicial implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated sequence of the synthetic human tropoelastin SHEL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  181 PIKAPKIPGGYGLPYTIGKLPYGYGPGGVAGAAGKAGYPTGTGVGPQAAAAAAAKAAAKF 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This represents the human elastin sequence containing the minimal continual intentional unit (MEV)-1 Dolypeptide of the invention. This MEV-1 is a polypeptide that has at least 3 beta-sheek beta-turn structures, but is not an anturally occurring finding protein. Each hear sheet structure is not an anturally occurring finding special. Each hear sheet structure con also be derived from the sequences of animal elastin, lampran and spider slik protein. The MEV polypeptides are self-aligning specials spider slik protein. The MEV polypeptides are self-aligning specials spider slik protein. The MEV polypeptides are self-aligning specials. They are used to coar proteinses plade of animal elastin lampran protein. They are used to coar proteinses plade of animal or synthetic material or Merall, particularly for use as biployd vessel or heart valve replacements. Occupation of high-tensile strength anturals. They are used in cosmetic, events or become permanent living, tissue replacements. The MEV polypeptides have become permanent living, tissue replacements. The MEV polypeptides have competiblicy than knort elastic and produce control in the MET allow penetrals. They are well defined, homogeneous material and hare assier to manipulate and produce than full laught elastins. They ale non-thromogenic and non-thromogenic and manipulate and properties to per tailored for particular applications, e.g. combining the control properties to be tailored for particular applications, e.g. combining the control of the protein.

                                                                                                                                                                                                                                               The invention relates to a derivative or variant of human tropcelastin (hrg) having elastin-like and/or micronoleule (specifical) adjugged elastin-like and/or micronoleule (specifical) adjugged (546)-binding picperites. Cells containing vectors comparising the macial caids emodiagly the variants or derivatives are successful proteins recomplimantly. The tropcalastin derivatives for pyroid proteins containing the derivatives are useful in medical, whereinary and cosquetic applications, e.g. as anti-writhe or hand lottions, also as sufgridoll implants, foods and industrial products. The hybrid protein have qentrollable GAG-binding properties, depending on presence or basecoe of a specific fragment, designated human tropcelastin variant SHELGAL (#268).

useful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts osteocytes, condrocytes and platelets. Peptidominetics that minic the protease cleavage site in tropoclastin derivatives are competitive inhibitors of the protease, and are used for protecting against Iung anamage caused by elastia, for inhibiting or controlling localized growth of cencers or metastases, or to limit protease ectivity that causes blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     PGYZPGGVLEGARFEGVGVLEGVETGAGÍÝRPKAPGVGGAFAGIEGVGPFGGEOFGVETGT 180

The present sequence represents a human elastin. Peptides derived
CC from elastin are used in compositions of the invention. The
Specification describes elastin based compositions that are potent
CC requistors of smooth muscle cell profiferation, differentiation and
CM migratical in vivo. The elastin-based compositions comprise at least one
CM elastic fibra- elastin-based compositions comprise at least one
CM biological activities comprising; inhibiting the proliferation of smooth
CM muscle cells in vivo; stimulating the differentiation of smooth muscle
CM of disorder characterized by diminished capacity to requiste smooth
CM of a disorder characterized by diminished capacity to requiste smooth
CM suppass graft stenois, transplant arteriopathy, aneurysm and/or
CM physertension, and transplant arteriopathy; aneurysm and/or
CM phypertension, and transplant arteriopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ë,

The present sequence represents a fusion protein, comprising human compositions of the invention. The specification describes elastin of compositions of the invention. The specification describes elastin compositions of the invention. The specification describes elastin bead compositions that are potent regulators of smooth muscle cells proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastinis tropoelastins inhibiting the proliferation of smooth muscle cells in vivo. According to inhibiting the proliferation of smooth muscle cells in vivo, and regulating the migration of smooth muscle cells in vivo, and regulating the migration of smooth muscle cells in vivo. The compositions may be used the differentiation of smooth will be a disorder observations may be used the minushed capacity to requibate smooth muscle cell function sich as a christopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy. Example 3; Page 48; 79pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a derivative or variant of human tropoelastin (http) having elastin-like and/or incrromolecule (specifical) bytoseaminojyton (686)-binding properties. Cells containing vectors comprising the nucleic acids encéding the variants or derivatives are used to broduce the proteins recombinantly. The tropoelastin derivatives or pybrid proteins containing the derivatives are useful in medical, which corteins containing the derivatives are useful in medical, which containing and signification applications, e.g. vas anti-yridite, or hand lottons, also as jungicial implants, foods and industrial products. The hybrid protein have controllable Gad-binding properties, depending on presence or absence of a specific fragment, designated peptide 264, from http: The present sequence represents a human tropoelastin derivative SEEJeltandelfied.

The present sequence represents a human tropoelastin derivative, which is representative, of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been matted so that susceptibility to protect or a subsequence bas been inserted so that susceptibility to protective size with reduced susceptibility and can be used where the avid-type protein vould be degraded too easily.

The suscential derivatives are not would be degraded too easily.

The derivatives provide competitive inhibition of protesse activity. The derivative protein expectation of protesse activity. The correction derivative proteins and other polypeptial of error protein of the inhibition of protesse activity. The protein derivative derived by the protein or propelastin derivative inhibition, as the protesse of the protesse and other mine the protesse cleavage site in tropoelastin derivatives are competitive inhibitors of the protesse and other tropoelastin derivatives are competitive inhibitors of the protesse and controlling localized growth of caneers or metastasses, or thinkit proteasse entirity that causes blood clotting.
derivatives of tropoelastin useful, e.g. for inducing chemotaxis cell growth \boldsymbol{\cdot}
                                                                                                                                                                                                                             Disclosure; Page 115-117; 136pp; English

This sequence contains 13 repeats of a block consisting of 8 elastin-like repeats followed by 4 fibroin-like repeats. The bits of 8 elastin-like repeats followed by 4 fibroin-like repeats. The bits of 8 elastin-like according these polymers were inserted into plasmadds which were constructed into plasmadds which were used to transform a cool is strain ECS. The polymers could then be considered strains by standard centrifugation certainsforms. The polymers sould then be certained strains by tended of entiting along the changes. The polymers are used to form a device (sich as a suture, comparing a general of film to keep separated withbe tissue together. By currying the the ratio of the two repetative units, and by altering the polymer can altered moderally By reducing the number of repeating units of this sequence. On by increasing the number of units of the elastin confinence of the second of plasmads when the second of series (see R80252) and SELP4 (see R80255) polymers showed intermediate resorption after construction of the weaks. The other three polymers showed intermediate resorption.

No data was given for SELP6 (see R80257).
                Protein polymer comprising alternating blocks of fibroin and elastin units — used to form a device e.g. a suture to keep separated viable tissue together.
                                                                                                                                                                                                                                                                                                            Fibroin; elastin; repeat sequence; suture; thread; pin; gel; silk; polymer; E.coli; EC3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               à
                                                                                     g
                                                                                                                                                                                                                                                                              The sequences represented by R80251-R80257 are polymers constructed of corposating Jlocks of fibbron-like (see R80454) and alsatin-like (see R80350) units. This sequence contains 18 repeats of a block consisting R80250) units. This sequence contains 18 repeats of a block consisting of 8 elastin-like (see R80450) units. This sequence contains 18 repeats of a block consisting contains a sequence anoding these polymers were inserted into plasmids which were used to transform E.coli strain ED. The polymers could then be consistent of isolated from the fermented strains by standard centrifigation of techniques. The polymers are used to form a device (such as a suture, polymer and real of film) to keep separated viable tissue together. By corpyring the the ratio of the two repetative units, and by alerting the lengths of the blocks of each of them, the tensile properties of the complexed moderally. By reducing the number of repeating units of this sequence, on by increasing the number of repeating units of this sequence and the fastest recorption rate. The SILP4 (see R80251) and SILP5 (see R80255) polymers showed no resorption. No data was given for SILP5 (see R80255).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62;

The protein compises 11 repeats of the pepticle sequence (GNOWTP) 8 (GARGS)4 inserted between 2 human fibrin gamma chain-derived peptide sequences. The protein can be used as a polymer substrate in a lappeptide cross linking reaction (cathysed by the Factor XIII transgluteannase enzymatic activity. The polymers can be used in biological systems where in situ formation of a biocompetible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            268 --GIAGVGTBRAAAAAAAAAAKAAAGLVPGGPGPGPGPGVGVPGAGVPGAGI 325-

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the zeaut being printed, and is derived by analysis of the total score distribution.

C. -1- ALTERNATURE PRODUCTS: 2 ISOPORMS; I (SHOWN HERE) AND II: ARE PRODUCTS BY ALTERNATURE SPICITING.

-1- DOMAIN: ALPER CHAINS OF TYPE IV COLLAGEN HAYE A NONCOLLAGENCUS DOMAIN (NC1) AT THEIR C.TERNINGS, PREQUENT INTERRUPTIONS OF THE GA-Y: REPEATS IN THE LONG SENTRAL FILE-BRILLOLD DOMAIN WHICH MAY CAUSE FLEXIBLIAN IN THE TRAIDS HEIRT, AND A SHOFT N-TERMINAL

-1- PHY PROLITES AT THE THIRD POSITION OF THE TRIPPHYIDS REPEATING OF THE CHIRD PROBATIONS OF THE CHIRD PROGRAMMS.

-1- PHY TYPE IY COLLAGENS CONTAIN WUMBEROUS CYSTERING STREETHERS HILLS AND THE TRIPPHY IN SHE CHAINS.

-1- PHY TYPE IY COLLAGENS CONTAIN WUMBEROUS CYSTERING SHILLS AND HATCH AND INVENTOR IN SOME THE CHIRD SHILLS.

-1- PHY TYPE IY COLLAGENS CONTAIN WUMBEROUS CYSTERING SHILLS AND HATCH AND INVENTOR DISCUSSIONED IN ALL KNOWN TYPE IY COLLAGENS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright.
